

6. What succeeded, what did not, and what is still unknown

WHAT THE CURRENT WORK SUPPORTS

- A reproducible saved native M0/M1 run, plus fish-aware audits.
- A larger growth-prior source-mass effect at 120–240 hpf.
- Positive complementary direction evidence at two intervals.
- Modest human expression-program concordance, with negative specificity tests.

WHAT REMAINS UNRESOLVED

- Actual division/death rates and true parent-descendant relationships.
- Negative absolute late-interval velocity agreement.
- Strong epsilon/tau sensitivity and sparse early sampling.
- Whether growth priors improve independent predictive performance.

HISTORY IS INCLUDED, NOT HIDDEN

- Earlier combined/reweighted models and smaller-marker-panel results.
- Cluster-23 exploratory trajectories, including mixed lineage markers.
- Partial notebooks and saved errors, explicitly labeled as historical.
